

Supported products

Skybox Vulnerability Detector and Intelligence Feed

The Skybox intelligence feed contains vulnerabilities published by the supported sources. These vulnerabilities are associated with more than 14,000 products. The vulnerabilities are added to the intelligence feed according to the affected product's priority. P1 is a list of critical or common products, P2 holds a larger group of enterprise-grade products, and the P3 list holds the long tail of other products.

Skybox's capabilities include the identification of services from asset data that is imported from patch management and asset management systems, or from configuration files of devices, and detection of vulnerabilities on these services using a "virtual scan" (known as Vulnerability Detector or VD). Skybox provides virtual scanning for a set of products that were found most important to our customers and the industry at large.

The Skybox® Vulnerability Detector feature of Skybox Vulnerability Control identifies vulnerabilities automatically daily without scanning. Vulnerability Detector supports the operating systems, browsers, software, and databases commonly used by enterprises and large government organizations. Supported products are listed below.

- Banner Translation product list (page 2)
- P1 products list (page 6)
- P2 products list (page 8)

The Banner Translator products list specifies the products that are identified and translated by our banner translator (other products appear in the model as "unidentified" or "generic OS"). The list of supported products is updated periodically. Most of these products allow vulnerability detection: vulnerabilities on these products, which appear in the dictionary, are discovered by Vulnerability Detector. The scope and speed of coverage of published vulnerabilities for these products is according to the SLA of their priority (P1, P2, or P3).

The intelligence feed is released by 11 a.m. Eastern Standard Time every day except Saturday. The Skybox Server can be configured to automatically update the data service from the internet on a scheduled basis.

The intelligence feed is released with vulnerability updates according to the following policy:

- Vulnerabilities affecting P1 products: published within one business day from public disclosure of vulnerabilities by the supported vendors or NVD
- Vulnerabilities affecting P2 products: published within seven days from public disclosure by NVD
- Vulnerabilities affecting P3 products: published gradually, after disclosure by NVD
- Exploitability: Published daily, to include proof-of-concept exploits and vulnerabilities exploited in the wild and popular malware
