

# Get a consolidated view of IT and OT networks

Italian natural gas provider selects an integrated Skybox Security and Nozomi Networks solution to manage their IT/OT security posture.

## Learn how you can:

- Integrate Nozomi Networks OT security technology with Skybox.
- Gain visibility of the complete IT/OT attack surface.
- Assess vulnerabilities and mitigate potential risks.

This **Italian natural gas provider** needed a complete picture of its security posture across Information Technology (IT) and Operational Technology (OT) networks. They chose the **Skybox Security Posture Management Platform** along with scanning technology from **Nozomi Networks** to deliver a single consolidated view.

## Business challenge

### Monitor and protect OT network devices

This organization controls the regulated activities in Italy's natural gas sector, managing the transport, storage, and regasification of natural gas. The organization operates in a highly regulated environment and must be able to demonstrate its compliance with health, safety, and environmental legislation, **ensure uptime and be ever vigilant in the fight against cyberattacks.**

The organization needed to monitor and protect its Supervisory Control and Data Acquisition (SCADA) assets from attack. These assets underpin a downstream network and storage infrastructure that spans Europe across over 40,000 km of pipeline and storage.

A key requirement was that the solution would complement their existing investments and enable them to see their consolidated security posture across both IT and OT networks.

“We needed to select the right technology for monitoring our OT networks and bridge the management gap between OT and IT to obtain a single view of our security posture.”

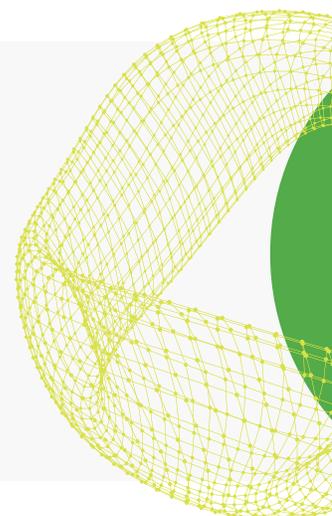

Italian natural gas provider

## Solution

### Get a single pane of glass view across OT and IT

The organization was already an established Skybox Security customer. So, when it came to selecting a technology that would help them monitor their OT and IIoT assets and devices, they wanted a solution that would integrate with Skybox to **give them a single pane of glass view across IT and OT.**

Following evaluation of several potential technology providers, the organization chose cyber security technology from Nozomi Networks to provide an integrated solution.

Skybox and Nozomi demonstrated that the out-of-the-box integration between the two technologies delivers a seamless view of assets, risks, and exposures across their IT and OT technology estate.

“We were impressed that the integration between Skybox and Nozomi worked straight out of the box. Data gathered from Nozomi Networks’ OT scanning technology is ingested into the Skybox platform so the team has an unparalleled level of visibility, from pipeline sensors to enterprise servers.”

Italian natural gas provider

#### Results

### Gain visibility and context across the IT/OT attack surface

The Skybox Security Posture Management platform comprises Firewall Assurance, Network Assurance, Change Manager, and Vulnerability Control modules. By integrating OT security scanning data from Nozomi Networks into the platform, the organization has gained visibility of the entire OT/IT estate from a single management console.

Sophisticated visualization and analytic features enable the organization to aggregate, dice, and slice the data to **understand their precise exposure to threats and vulnerabilities.**
